

Exercise

student detail diagram using classes and objects.

Chapter - 10 (OOPS)

Object oriented programming (OOP) is a programming paradigm that organize code that contain both data (attribute) and behaviour (methods)

Key concepts of OOPS

Class	A Blueprint of creating object
Object	An instance of class with specific data and behaviour.
Attributes	Variables that store data for an object
Methods	function inside a class that defined Object behaviour.
Encapsulation	Restricting direct access the object's data.
Inheritance	Creating a new class from an existing class
Polymorphism	using the same method name for different class.

Define class and creating objects
Creating a class.

Class Student :

```
def __init__(self, name, age, roll):
```

```
    self.name = name
```

```
    self.age = age
```

```
    self.roll = roll
```

```
def showDetail(self):
```

```
    print(self.name, self.age, self.roll)
```
