

Example

```
class Student:  
    school_name = "ABC school" # class attribute  
  
    def __init__(self, name):  
        self.name = name
```

```
@classmethod  
def change_school(cls, new_name):  
    cls.school_name = new_name
```

```
print(Student.school_name) # ABC school  
Student.change_school("xyz")  
print(Student.school_name) # xyz
```

Exercise Game ranking system

Exercise: Gaming tournament registration system

Idea: Each Player has different name, game ID, different ^{score}, Registration status.

- ⊙ Tournament name is same for all.
- ⊙ Entry fee is same
- ⊙ Total Player count should increase auto

Day-30

class methods

A class method is a method that works with class itself, not with individual objects

It uses the decorator

@classmethod

difference between methods

Method Type	first parameter	works with
instance Method	self	Object data
class Method	cls	Class data
Static Method	None required	Utility logic

why do we use class method

- modify class variable
- Access class-level data
- Create Alternative constructor
